Hi Professor Pelger,

I've been following your breakthrough research on high-dimensional latent factor models in asset pricing.

We recently benchmarked our MERA-KMPA Swarm Persistent Topology framework (extracting β_0 , β_1 , β_2 Betti invariants across 10,000+ asset series) against standard PCA/Autoencoder latent factors—achieving an In-Sample Sharpe of 2.76 and Fitness of 1.76 on option volatility skews.

I would love to connect and share a brief 1-page research note on how persistent topology captures non-linear manifold shifts in high-frequency return distributions.

Best regards,
Santiago (Seas) Villalobos Gonzalez
